

We champion native plants for all the benefits that they provide to our environment, including the important role they play in supporting honeybees and all native insects – including native bees, butterflies, moths, beetles and all the rest.

We use an integrated pest management (IPM) approach to manage any pest problems that come up, whether they be insect pests, diseases or weeds. We are around these plants all day, every day. If we find we do need to intervene, we use organic methods as much as possible. We do not, and never have, used any neonicotinoid pesticides.
